## MATHEMATICS

**9709/62**

Paper 6 Probability &amp; Statistics 2

February/March 2023

**1 hour 15 minutes**

You must answer on the question paper.

You will need: List of formulae (MF19)

## INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- If additional space is needed, you should use the lined page at the end of this booklet; the question number or numbers must be clearly shown.
- You should use a calculator where appropriate.
- You must show all necessary working clearly; no marks will be given for unsupported answers from a calculator.
- Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place for angles in degrees, unless a different level of accuracy is specified in the question.

## INFORMATION

- The total mark for this paper is 50.
- The number of marks for each question or part question is shown in brackets [ ].

This document has **16** pages. Any blank pages are indicated.

**BLANK PAGE**

- (a) Calculate an approximate 98% confidence interval for the proportion,  $p$ , of students at Anita's college who watch *Bunch*. [3]

[illegible]

Carlos says that the confidence interval found in **(a)** is not useful because it is too wide.

- (b) Without calculation, explain briefly how Carlos can use the results of Anita's survey to find a narrower confidence interval for  $p$ . [1]

- 2 The number of orders arriving at a shop during an 8-hour working day is modelled by the random variable  $X$  with distribution  $Po(25.2)$ .

(a) State **two** assumptions that are required for the Poisson model to be valid in this context. [2]

.....

.....

.....

.....

(b) (i) Find the probability that the number of orders that arrive in a randomly chosen 3-hour period is between 3 and 5 inclusive. [3]

.....

.....

.....

.....

.....

.....

(ii) Find the probability that, in two randomly chosen 1-hour periods, exactly 1 order will arrive in one of the 1-hour periods, and at least 2 orders will arrive in the other 1-hour period. [4]

.....

.....

.....

.....

.....

.....

.....

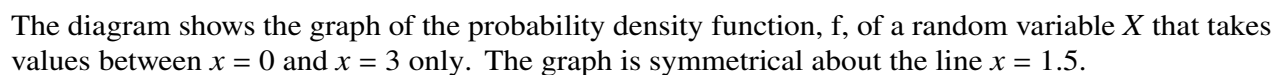

.....

.....

.....

- Use a suitable approximating distribution to find the probability that, in a randomly chosen 36-hour period, there will be too many orders for the shop to deal with. [4]

This image shows a blank sheet of white paper with horizontal ruling lines. The lines are evenly spaced and extend across the width of the page. In the bottom right corner, there is a small, partially visible circular logo. The logo has a blue border and contains the word "AHEAD" in white capital letters. Below the word "AHEAD", there is a red circle. The rest of the logo is cut off by the edge of the page.

- Find  $P(0.6 < X < 1.8)$  in terms of  $a$  and  $b$ . [2]

This image shows a full page of blank handwriting practice paper. It has multiple rows of horizontal lines. Each row consists of a solid top line, a dashed middle line, and a solid bottom line. In the bottom right corner, there is a partial view of a circular logo with the words "GO AHEAD" written around it.

(b) It is now given that the equation of the probability density function of  $X$  is

$$f(x) = \begin{cases} kx^2(3-x)^2 & 0 \leq x \leq 3, \\ 0 & \text{otherwise,} \end{cases}$$

where  $k$  is a constant.

(i) Show that  $k = \frac{10}{81}$ . [3]

.....

.....

.....

.....

.....

.....

.....

.....

(ii) Find  $\text{Var}(X)$ . [3]

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

- 4** The number of accidents per 3-month period on a certain road has the distribution  $\text{Po}(\lambda)$ . In the past the value of  $\lambda$  has been 5.7. Following some changes to the road, the council carries out a hypothesis test to determine whether the value of  $\lambda$  has decreased. If there are fewer than 3 accidents in a randomly chosen 3-month period, the council will conclude that the value of  $\lambda$  has decreased.

**(a)** Find the probability of a Type I error.

[2]

.....

.....

.....

.....

.....

.....

.....

.....

**(b)** Find the probability of a Type II error if the mean number of accidents per 3-month period is now actually 0.9.

[3]

.....

.....

.....

.....

.....

.....

.....

.....

- 5 The masses, in grams, of large and small packets of Maxwheat cereal have the independent distributions  $N(410.0, 3.6^2)$  and  $N(206.0, 3.7^2)$  respectively.
- (a) Find the probability that a randomly chosen large packet has a mass that is more than double the mass of a randomly chosen small packet. [5]

[illegible]

The packets are placed in boxes. The boxes are identical in appearance. 60% of the boxes contain exactly 10 randomly chosen large packets. 40% of the boxes contain exactly 20 randomly chosen small packets.

- (b)** Find the probability that a randomly chosen box contains packets with a total mass of more than 4080 grams. [6]

A series of horizontal dotted lines for writing.

A circular logo in the bottom right corner with the text "GO AHEAD" in a stylized font. The logo is partially cut off by the edge of the page.

- 6 Last year, the mean time taken by students at a school to complete a certain test was 25 minutes. Akash believes that the mean time taken by this year's students was less than 25 minutes. In order to test this belief, he takes a large random sample of this year's students and he notes the time taken by each student. He carries out a test, at the 2.5% significance level, for the population mean time,  $\mu$  minutes. Akash uses the null hypothesis  $H_0: \mu = 25$ .

- (a) Give a reason why Akash should use a one-tailed test. [1]

.....

.....

.....

Akash finds that the value of the test statistic is  $z = -2.02$ .

- (b) Explain what conclusion he should draw. [2]

.....

.....

.....

.....

In a different one-tailed hypothesis test the z-value was found to be 2.14.

- (c) Given that this value would lead to a rejection of the null hypothesis at the  $\alpha\%$  significance level, find the set of possible values of  $\alpha$ . [3]
